

Spectrasfalt® Rubi-Joint [RJ]

System

Hot-application chipping reinforced system combined with hot rubber bitumen.

Use

As a waterproof flexible asphalt strip above moving joints and at joints between asphalt concrete and concrete steel, plastic or timber. The waterproof strip prevents penetration of dirt, water and road salt into the joint.

Applications

On structures, as a flexible joint in the road surface above dilatation joints. Also as a flexible jointing strip between road surface and curb construction.

Product and characteristics

Joints made from Spectrasfalt RJ are smoother and quieter, thus enhancing the driving comfort of the road user and reducing noise nuisance for those living nearby. Jointing strips between asphalt concrete and the curb construction have been developed to protect surface structures against moisture penetration.

Asphalt mixtures can be difficult to compact along the edges; replacing this edge strip with a flexible, strongly bonding Spectrasfalt RJ joint solves this problem. Spectrasfalt RJ joints are quick to apply and require little maintenance.
